# DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206120124 INORGANICS

Validation of the inorganics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November and December 2006, was conducted by Earth Tech using the National Functional Guidelines for Inorganic Data Review, (US EPA, February, 1994), as appropriate. The results were reported by GCAL under Sample Delivery Group (SDG) 206120124.

#### INTRODUCTION

Analyses of metals were performed according to Contract Laboratory Program (CLP)-Inorganic Analysis Multi-media Multi-concentration ILM04.1 Statement of Work (SOW). Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values maybe used without reservation. The laboratory to denote specific information regarding the analytical results uses various qualifier codes.

The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user.

Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

- U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Details of the inorganics data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. Calibration

It rappe

- A. Initial Calibration (IC)
- B. Continuing Calibration (CC)
- 3. Blanks
- 4. Inductively Coupled Plasma (ICP) Interference Check Sample
- 5. Laboratory Control Sample (LCS)
- 6. Duplicate Analysis
- 7. Spike Sample Analysis
- 8. ICP Serial Dilution
- 9. System Performance

- 10. Documentation
- 11. Overall Assessment

#### 1. HOLDING TIMES

All samples for inorganics analyses were analyzed within the 180-day holding time for preserved aqueous samples. Mercury analyses were conducted within the 28-day holding time for aqueous samples undergoing CLP protocol. Cyanide analyses were conducted within the 14-day holding time. The cooler temperature upon receipt at the laboratory was within the recommended temperature of  $4^{\circ}\text{C}$  +/-  $2^{\circ}\text{C}$ .

#### 2. CALIBRATION

#### A. Initial Calibration

The percent recoveries for the Initial Calibration Verification (ICV) standard were within Quality Control (QC) limits for all constituents.

#### B. Continuing Calibration

The percent recoveries for the Continuing Calibration Verification (CCV) standard were within QC limits for all constituents.

#### 3. BLANKS

hiki dae

The Initial Calibration Blank (ICB), Continuing Calibration Blanks (CCB) and Preparation Blanks (PB) were analyzed at the appropriate frequencies. No constituents were detected in the ICB, CCB, and PB blanks above the corresponding Contract Required Detection Limit (CRDL).

#### 4. ICP INTERFERENCE CHECK SAMPLE

Results for the ICP analysis of the Interference Check Sample (ICS) solution AB were within 20% of the true value.

#### 5. LABORATORY CONTROL SAMPLES

Recoveries were within the control limit (80-120%) for all constituents.

#### 6. DUPLICATE ANALYSIS

The laboratory used samples SK-SW50-1020 (total and dissolved) and SK-SW85-1020 (total and dissolved) for the duplicate samples. The Relative Percent Difference (RPD) between the sample and duplicate results for the total and dissolved fractions were within the acceptance criteria (<20%) for all target analytes.

#### 7. SPIKE SAMPLE ANALYSIS

The laboratory used samples SK-SW50-1020 (total and dissolved) and SK-SW85-1020 (total and dissolved) for the matrix spike sample. The MS percent recoveries were within the acceptance criteria (75%-125%) except as follows:

| Arsenic (70%) | SK-SW50-1020 total fraction     |
|---------------|---------------------------------|
| Arsenic (70%) | SK-SW50-1020 dissolved fraction |
| Arsenic (70%) | SK-SW85-1020 dissolved fraction |
| Selenium (0%) | SK-SW85-1020 dissolved fraction |

As per the National Functional Guidelines, if the percent recovery is greater than 30% but less than 75% qualify results greater than the IDL with "J" and non-detected results with "UJ". If the percent recovery is less than 30% qualify detected results for that analyte with "J" and non-detected results for that analyte with "R".

#### 8. ICP SERIAL DILUTION

As noted in the National Functional Guidelines: If the analyte concentration is at least 50 times above the IDL, its serial dilution analysis must then agree within 10% of the original determination after corrected for dilution. The serial dilution is performed to determine whether any significant chemical or physical interference's exist due to matrix effects. The serial dilution percent differences were within the acceptance criteria for all target analytes with the exception of Calcium, Iron, Magnesium, Potassium, and Sodium. As per the National Functional Guidelines, if the serial dilution percent criterion is not meet then qualify the associated data as estimated with a "J".

It should be noted that the laboratory did not analyze a serial dilution for the dissolved fraction.

#### 9. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data.

#### 10. DOCUMENTATION

The concentration for Mercury associated with the CRDL was reported as 0.300 when it should have been reported as 0.25608. The data validator manually made the correction.

The laboratory qualified the Aluminum results with an "E" qualifier to indicate that the acceptance criteria for the serial dilution were outside of the control limit. The results should not have been qualified because the initial concentration of the Aluminum was not greater than fifty times the IDL and therefore the 10% criterion did not apply. The data validator manually made the corrections on the Form's I and IX.

#### 11. OVERALL ASSESSMENT

The percent recoveries for Arsenic in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 128%, 119%, and 122%.

The percent recoveries for Manganese in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 121%, 124%, and 124%.

The percent recoveries for Mercury in the Contract Required Detection Limit (CRDL) standards analyzed on 12/11/06 was 133%.

The percent recoveries for Selenium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 135%, 135%, and 146%.

The percent recoveries for Silver in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 122%, 122%, and 120%.

The percent recoveries for Thallium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 107%, 122%, and 116%.

The percent recoveries for Arsenic in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 134 and 124%.

The percent recoveries for Chromium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 123% and 124%.

The percent recoveries for Manganese in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 128% and 127%.

The percent recoveries for Selenium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 117% and 136%.

As per the National Functional Guidelines, if the CRDL is above 120% then detected results are qualified as estimated with "J".

The results are acceptable with the validator-added qualifiers.

# DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206120124 SEMIVOLATILE ORGANICS

Validation of the Gas Chromatograph/Mass Spectrometer (GC/MS) semi-volatile organics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November and December 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999) as appropriate. The results were reported by GCAL under SDG 206120124.

| GCAL#       | Sample Description   |

- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Details of the semivolatile data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. GC/MS Tuning
- 3. Calibration
  - A. IC
  - B. CC
- 4. Blanks
- 5. System Monitoring Compound Recovery
- 6. MS/MSD
- 7. Internal Standards Performance
- 8. Compound Identification
- 9. Constituent Quantitation and Reported Detection Limits
- 10. System Performance
- 11. Documentation
- 12. Overall Assessment

#### 1. HOLDING TIMES

The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C. All samples were initially extracted within the seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time. Samples SKSW85-1020, SKSW85-1020 MS, and SKSW85-1020 MSD were re-extracted due to system monitoring compounds and internal standards being outside of the acceptance criteria. The re-extraction was performed outside of the recommended seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time. As per the National Functional Guidelines, if the holding time is exceeded then qualify detected results with "J" and non-detected results with "UJ".

#### 2. GC/MS TUNING

The samples were analyzed on a single GC/MS system, identified as MSSV3. One decafluorotriphenylphosphine (DFTPP) tune was run representing the shift in which the standards and samples were analyzed. The DFTPP tune is acceptable.

#### 3. CALIBRATION

#### A. Initial Calibration

1 1882

Three ICs dated 12/21/06, 12/26/06, and 1/2/07 were analyzed on instrument MSSV3 in support of the semivolatile sample analyses. Documentation of the IC was present in the data package, and the Relative Response Factor (RRF), as well as percent Relative Standard Deviation (%RSD) values were accurately reported for all target compounds. The criteria employed for technical data review purposes are different than those used in the method. The laboratory must meet a minimum RRF of 0.01; however, for data review purposes, a RRF criterion of "greater than or equal to 0.05" is applied to all semi-volatile compounds. The RRF's and the average RRF for the IC's were within the acceptance criteria specified in the method for all target compounds. The %RSD's were within the acceptance criteria specified in the method for all target analytes with the exception of 4-Chloroaniline associated with the IC dated 12/26/06. The data validator dropped the highest point of the calibration curve for 4-Chloroaniline and re-calculated the %RSD. The re-calculated %RSD for 4-Chloroaniline was 25.8% which is within the acceptance criteria of less than or equal to 30%.

#### B. Continuing Calibration

Three CC's dated 12/21/06, 12/26/06, and 1/2/07 were analyzed in support of the semivolatile sample analyses reported in the data submissions. The percent difference (%D) between the average RRF's and the CC Response Factors for the CC were within the acceptance criteria (<25%) for the CC dated 12/21/06. The percent difference (%D) between the average RRF's and the CC Response Factors for the CC were within the acceptance criteria (<25%) for the CC dated 12/26/06 with the exception of 4-Chloroaniline (30.8%). The percent difference (%D) between the average RRF's and the CC Response Factors for the CC were within the acceptance criteria (<25%) for the CC dated 1/2/07 with the exception of 4-Chloroaniline (32.1%).

As per the National Functional Guidelines, if the %D is outside the  $\pm$  25% criterion then qualify detected results for that compound with "J" and non-detected results for that compound with "UJ".

#### 4. BLANKS

Two laboratory semivolatile method blank and an Equipment Blank were analyzed with this SDG. The results are summarized below.

#### Method Blank (MB435220)

Di-n-butylphthalate was detected at a concentration of 0.629 ppb in the method blank extracted on 12/24/06.

#### Method Blank (MB443446)

Di-n-butylphthalate (1.64 ppb) and bis(2-ethylhexyl) phthalate (1.93 ppb) were detected in the method blank extracted on 12/21/06.

# Equipment Blank (SKEB2-1020)

There were no target compounds detected in the Equipment Blank collected on 11/30/06.

#### 5. SYSTEM MONITORING COMPOUND RECOVERY

All reported semivolatile system monitoring compounds (SMC) were recovered within acceptable control limits with the exception of 2-Fluorobiphenyl (high), Phenol-d5 (< 10%), and 2,4,6-Tribromophenol (high) associated with SKSW85-1020 MS and MSD and Therphynl-d14 (high) associated with SKSW85-1020 MSD. As per the National Functional Guidelines, if two or more SMC have a recovery greater than the acceptance criteria qualify detected compounds for that fraction with "J". If any SMC has a recovery less than 10% qualify detected compounds for that fraction with "J" and non-detected results are qualified with "R".

# 6. MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD)

Samples SK-SW50-1020 and SK-SW85-1020 were submitted for MS/MSD analysis. The MS/MSD percent recoveries were within the acceptance criteria with the exception of 4-Nitrophenol associated with the MSD for both samples. As per the National Functional Guidelines, no action is taken on MS/MSD data alone.

#### 7. INTERNAL STANDARDS PERFORMANCE

Internal standard (IS) areas and Retention Times (RT) were within the acceptance limits for the reported semivolatile samples with the exception of Acenaphthene-d10 (extremely low) and Perylene-d12 (extremely low) associated with SKSW85-1020 MS and MSD and Chrysene-d12 (extremely low) associated with SKSW85-1020 MSD.

As per the National Functional Guidelines, if the IS area count is outside -50 percent or +100 percent of the area for the associated standard then qualify detected results with "J". Non-detected compounds quantified using an IS area count less than 50 percent are qualified with "UJ" unless the area count is extremely low in which the non-detected results are qualified with "R".

# 8. COMPOUND IDENTIFICATION

All reported semivolatile constituents were correctly identified with supporting chromatograms present in the data package.

# 9. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported for semivolatile constituents.

#### 10. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data submitted for review.

#### 11. DOCUMENTATION

اخترت ا

There was no extraction date listed on the Form IV submitted in the data package. There were no sample volumes, units, levels, date extracted, or preparation method listed on Form I SV-TIC. The analytical method reported by the GCAL on the Form I SV-TIC was listed as SW-846 8270C when it should have been listed as OLM04.2. The data validator manually made the corrections.

#### 12. OVERALL ASSESSMENT

Although there were problems associated with the initial extraction and analysis of the MS/MSD for sample SK-SW85-1020 there were no other QC related issues therefore the data validator recommends using the results from the initial extraction since the extraction was performed within the recommended holding time. Although the re-extraction of samples SK-SW85-1020, SK-SW85-1020 MSD were performed outside of the recommended holding time there were no other QC related problems associated with the analysis. The results are acceptable with the validator-added qualifiers.

# DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206120124 VOLATILE ORGANIC

Validation of the GC/MS volatile organics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November and December 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999), as appropriate. The results were reported by GCAL under SDG 206120124.

#### INTRODUCTION

Analyses were performed according to CLP-Organic Analysis Low Concentration OLC02.0 SOW. Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. The laboratory to denote specific information regarding the analytical results uses various qualifier codes. The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user. Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.

\* 1894

- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

The volatiles data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. GC/MS Tuning
- 3. Calibration
  - A. IC
  - B. CC
- 4. Blanks
- 5. System Monitoring Compound Recovery
- 6. MS/MSD
- 7. Laboratory Control Sample
- 8. Internal Standards Performance
- 9. Compound Identification
- 10. Constituent Quantitation and Reported Detection Limits
- 11. System Performance
- 12. Documentation
- 13. Overall Assessment

Magazi

#### 1. HOLDING TIMES

All samples for Volatile Organic Compounds (VOC) analyses were analyzed within the 14-day technical holding time and the 10-day VTSR method holding time. The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C.

#### 2. GC/MS TUNING

The samples were analyzed one GC/MS system, identified as MSV7. Two bromofluorobenzene (BFB) tunes were run on MSV7. The BFB tunes are acceptable.

#### 3. CALIBRATION

#### A. Initial Calibration

One IC dated 12/6/06 was analyzed on instrument MSV7 in support of the volatile sample analyses reported in the data submissions. Documentation of the IC standards is present in the data package, and RRF's as well as %RSD values were accurately reported. The criteria employed for technical data review purposes are different than those used in the method. The laboratory must meet a minimum RRF of 0.01; however, for data review purposes, a RRF criterion of "greater than or equal to 0.05" is applied to all volatile compounds.

The RRF's and the average RRF for the IC were within the acceptance criteria specified in the method for all target compounds with the exception of Acetone associated with the IC dated 12/6/06. The %RSD's were within the acceptance criteria specified in the method for all target compounds. As per the National Functional Guidelines, if any IC RRF is less than 0.05 then qualify detected results for that compound with "J" and non-detected results for that compound with "R".

# B. Continuing Calibration

Two CC's dated 12/6/06 and 12/7/06 were analyzed on instrument MSV7 in support of the volatile sample analyses reported in the data submissions. The percent difference (%D) between the average RRF's and the CC RF's for the CC dated 12/6/06 were within the acceptance criteria for all target compounds. The CC RRF's for the CC's dated 12/6/06 and 12/7/06 were within the acceptance criteria specified in the method for all target compounds with the exception of Acetone. The Acetone results were previously qualified under the Section 3A titled "Initial Calibration" therefore no further action was warranted.

#### 4. BLANKS

141000

Two laboratory volatile method blanks, a storage blank, two Trip Blanks, and an Equipment Blank were analyzed with this SDG. The results are summarized below.

and the company of the second of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the company of the

# MB436174

The following compounds were detected in the method blank analyzed on 12/6/06 (1747):

| Compound               | Concentration |
|------------------------|---------------|
| Acetone                | 1.6 ppb       |
| Tetrachloroethene      | 0.022 ppb     |
| Ethylbenzene           | 0.017 ppb     |
| Styrene                | 0.016 ppb     |
| Total Xylenes          | 0.057 ppb     |
| 1,3-Dichlorobenzene    | 0.026 ppb     |
| 1,2-Dichlorobenzene    | 0.095 ppb     |
| 1,4-Dichlorobenzene    | 0.048 ppb     |
| 1,2,4-Trichlorobenzene | 0.073 ppb     |

# MB436374

Hippard'

The following compounds were detected in the method blank analyzed on 12/7/06 (0927):

| Compound               | <u>Concentration</u> |
|------------------------|----------------------|
| Acetone                | 1.6 ppb              |
| Total Xylenes          | 0.019 ppb            |
| 1,3-Dichlorobenzene    | 0.012 ppb            |
| 1,2-Dichlorobenzene    | 0.071 ppb            |
| 1,2,4-Trichlorobenzene | 0.033 ppb            |

# Storage Blank (VHBLK)

The following compounds were detected in the in the Storage Blank analyzed on 12/7/06.

| Compound               | <b>Concentration</b> |
|------------------------|----------------------|
| 1,2,4-Trichlorobenzene | 0.034 ppb            |
| 1,2-Dichlorobenzene    | 0.070 ppb            |
| 1,3-Dichlorobenzene    | 0.014 ppb            |
| Methylene chloride     | 0.10 ppb             |
| Total Xylenes          | 0.021 ppb            |

# Equipment Blank (SKEB2-1020)

The following compounds were detected in the equipment blank collected on 11/30/06 (1610):

| Compound           | Concentration |
|--------------------|---------------|
| Benzene            | 0.037 ppb     |
| Ethylbenzene       | 0.041 ppb     |
| Methylene chloride | 0.19 ppb      |
| Styrene            | 0.023 ppb     |

| Compound      | Concentration |
|---------------|---------------|
| Toluene       | 0.16 ppb      |
| Total Xylenes | 0.082 ppb     |

The Ethylbenzene and Styrene detected in the Equipment Blank (with the exception of Benzene, and Toluene) were mitigated by the presence of Ethylbenzene, Methylene chloride, and Styrene in the associated method blank or storage blank.

# Trip Blank

Acetone (2.3 ppb), Ethylbezene (0.024 ppb), Methylene chloride (2.1 ppb), Styrene (0.028 ppb) and 2-Butanone (0.65 ppb) were detected in the Trip Blank associated with the sample received on 12/1/06. The Acetone, Ethylbenzene, Methylene chloride, and Styrene detected in the Trip Blank were mitigated by the presence of Acetone, Ethylbenzene, Methylene chloride, and Styrene in the associated method blank or storage blank.

### Trip Blank

The following compounds were detected in the Trip Blank associated with the sample received on 12/2/06.

| Compound           | Concentration |
|--------------------|---------------|
| Acetone            | 4.7 ppb       |
| 2-Butanone         | 1.0 ppb       |
| Chloroform         | 0.022 ppb     |
| Ethylbenzene       | 0.027 ppb     |
| Methylene chloride | 2.4 ppb       |
| Styrene            | 0.036 ppb     |
| Total Xylenes      | 0.012 ppb     |
|                    |               |

The Acetone, Ethylbenzene, Methylene chloride, Styrene, and Total Xylenes detected in the Trip Blank were mitigated by the presence of Acetone, Ethylbenzene, Methylene chloride, Styrene, and Total Xylenes in the associated method blank or storage blank.

#### 5. SYSTEM MONITORING COMPOUND RECOVERY

All reported volatile system monitoring compounds (SMC) were recovered within acceptable control limits (80%-120%).

#### 6. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Samples SK-SW50-1020 and SK-SW85-1020 were submitted for the MS/MSD analysis. The MS/MSD percent recoveries were within the acceptance criteria. The RPD between the compounds were within the acceptance criteria.

#### 7. LABORATORY CONTROL SAMPLE

Two Laboratory Control Samples were analyzed in conjunction with this SDG. Recoveries were within the control limit for all constituents.

#### 8. INTERNAL STANDARDS PERFORMANCE

Internal Standard (IS) areas and retention times were within acceptable limits for the reported volatile sample analyses.

#### 9. COMPOUND IDENTIFICATION

All reported VOCs were correctly identified with supporting chromatograms present in the data package.

# 10. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported for VOCs.

#### 11. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data.

# 12. **DOCUMENTATION**

There was no Form III VOA for the reporting of the LCS percent recoveries. The data validator made the calculations manually.

#### 13. OVERALL ASSESSMENT

The results are acceptable with the validator-added qualifiers.

....

# DATA VALIDATION SUMMARY - SAMPLE DELIVERY GROUP 206120124 PESTICIDES

Validation of the Gas Chromatography (GC) pesticides data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November and December 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999), as appropriate. The results were reported by GCAL under SDG 206120124.

- 6. Surrogate Spikes
- 7. Matrix Spike/Matrix Spike Duplicate (MS/MSD)
- 8. Pesticide Cleanup Checks
- 9. Target Compound Identification
- 10. Constituent Quantitation and Reported Detection Limits
- 11. Documentation
- 12. Overall Assessment

#### 1. HOLDING TIMES

The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C. All samples were extracted within the seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time.

#### 2. GC/ECD INSTRUMENT PERFORMANCE CHECK

The Performance Evaluation Mixture (PEM) was analyzed at the correct frequency. Absolute retention times were within limits. The percent resolution between adjacent peaks was within QC limits for the Pesticide Analyte Resolution Check. The percent resolution between adjacent peaks is within QC limits for the Performance Evaluation Mixtures (PEM).

The percent breakdown for both 4,4'-DDT and Endrin in each PEM was less than 20.0% for both GC columns. The combined percent breakdown for 4,4'-DDT and Endrin in each PEM was less than 30.0% for both GC columns.

#### 3. INITIAL CALIBRATION

Individual standard mixtures A and B were analyzed at the correct frequencies and concentrations. The percent resolution criterion for Individual standard mixtures A and B were within the acceptance criteria.

The Percent Relative Standard Deviation (%RSD) of the calibration factors for each of the single component pesticides was less than 20%. The multi-component target compounds were analyzed separately on both columns at a single concentration level. Retention times were determined from a minimum of three peaks.

#### 4. CALIBRATION VERIFICATION

Absolute retention times were within appropriate time retention windows. The percent difference for each of the pesticides and surrogates in the PEM's were within the acceptance criteria of  $\pm 25.0$  percent for the calibration verifications.

#### 5. BLANKS

1 mar salah

· liberan

Three laboratory method blanks and an Equipment blank were analyzed with this SDG. The results are summarized below.

#### Method Blank 434691

No constituents were reported by GCAL for the method blank extracted on 12/1/06.

#### Method Blank 435221

No constituents were reported by GCAL for the method blank extracted on 12/4/06.

#### Method Blank 436322

No constituents were reported by GCAL for the method blank extracted on 12/7/06.

### Equipment Blank SKEB-1020

No target compounds were detected in the Equipment Blank collected on 11/30/06.

#### 6. SURROGATE SPIKES

Decachlorobiphenyl (DCB) and tetrachloro-m-xylene (TCX) surrogate spike recoveries were within the acceptance criteria (30% - 150%).

#### 7. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Samples SK-SW50-1020 and SK-SW85-1020 were submitted for MS/MSD analysis. All of the percent recoveries associated with the MS/MSD were within the acceptance criteria with the exception of the following: Lindane associated with the MS/MSD for sample SK-SW50-1020. All of the RPD's between the MS/MSD were within the acceptance criteria except for Lindane associated with sample for sample SK-SW50-1020. As per the National Functional Guidelines, no action is taken on MS/MSD data alone.

#### 8. PESTICIDE CLEANUP CHECKS

Recoveries of all pesticides and surrogates were within 80-120% for the lot of Florisil cartridges utilized for pesticide cleanup.

#### 9. TARGET COMPOUND IDENTIFICATION

All reported pesticide data were correctly identified with supporting chromatograms present in the data package.

# 10. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported.

#### 11. DOCUMENTATION

The extraction type and date extracted was not reported on Form IV for method blank 413580. The data validator manually made the correction.

#### 12. OVERALL ASSESSMENT

The results are acceptable as qualified by the data validator.

#### CASE NARRATIVE

Client: Earth Tech Report: 206120124

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the sample cross-reference page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

Selected pages of the report are resubmitted to correct the quantitation of samples and QC in the OLM04.2 - CLP Pest/PCB analysis. All samples, QC, PEM, INDAM, and INDBM were re-quantitated using the mid-point of the ICAL. Forms and raw data are resubmitted as required.

Form IIIs for the OLC02.1 Volatile analysis are submitted as additions. Forms IIC, IVB, VB, and VIII are resubmitted for the OLM04.2 Semi-volatiles analysis to include sample SKSW85-1020.

#### SEMI-VOLATILES MASS SPECTROMETRY

In the OLM04.2 Semi-volatiles analysis, samples 20612012419 (SKSW85-1020 MS) and 20612012420 (SKSW85-1020 MSD) required re-extraction due to internal standard response, spike recovery, and surrogate recovery failures. This also required that the original sample (20612012419 (SKSW85-1020)) be re-extracted. The re-extraction was performed outside the sample holding time. The re-extract data is reported as samples 20612012426 (SKSW85-1020 (RE)), 20612012427 (SKSW85-1020 MS (RE)) and 20612012428 (SKSW85-1020 MSD (RE)).

#### SEMI-VOLATILES GAS CHROMATOGRAPHY

In the OLM04.2 - CLP Pest/PCB analysis for prep batch 338064 and 338342, the MS/MSD exhibited recovery and RPD failures. These recoveries were within limits in the LCS and/or LCSD. This is attributed to matrix interference.

In the OLM04.2 - CLP Pest/PCB analysis for prep batch 338064, no MS/MSD is reportable because the batch QC sample required re-extraction and is included in a different prep batch.

#### **METALS**

1 march

In the ILM04.1 - CLP Metals analysis for prep batch 338214, the MS and/or MSD recovery was outside the control limits for Arsenic and Selenium. The LCS recovery was within the control limits. This indicates the analysis is in control and the sample is affected by matrix interference.

In the ILM04.1 CLP HG analysis the Sample/Duplicate RPD for Mercury for prep batch 338215 is not applicable because the sample and/or duplicate concentration is less than five times the reporting limit.

In the ILM04.1 - CLP Metals analysis the Sample/Duplicate RPD for Aluminum, Cobalt, Copper, Zinc and Iron for prep batch 338214 are not applicable because the sample and/or duplicate concentration is less than five times the reporting limit. Aluminum, Calcium, Iron, Magnesium. Potassium and Sodium are flagged as estimated due to the fact that the percent difference between the original sample result and the serial dilution result is greater than 10. A chemical or physical interference is suspected.

# Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.
